What seperates a highly rated restaurant from the rest?
Is a 4.5 - star restaurant really better than a 4.1?

Intro:- Langkawi averages 4.2 stars on google reviews and 4.6 on Tripadvisor same island, so what does a star rating tell you?
Let us explore these statistics

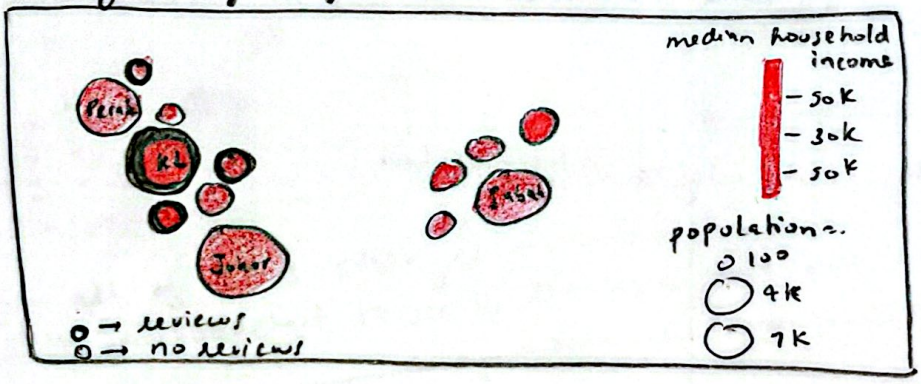

1. Who gets reviewed?

Reviews come from some places, let us see where

proportional symbol map

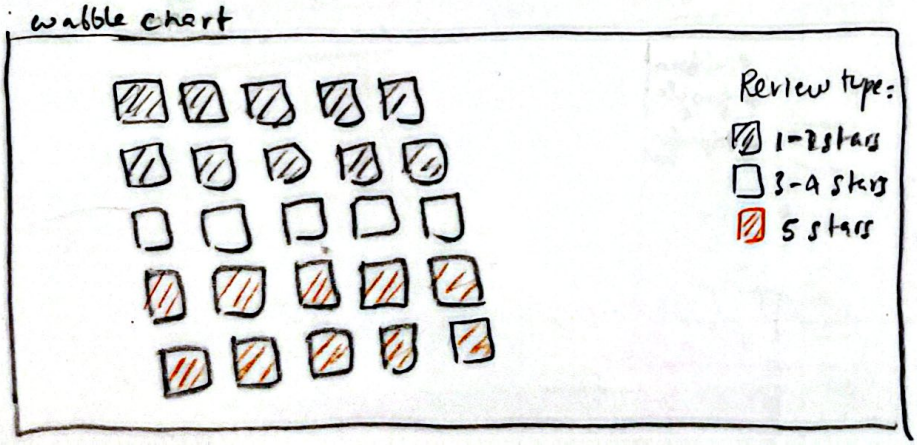

Porling Cartogram for median household income

2. Do stars seperate good from Bad?

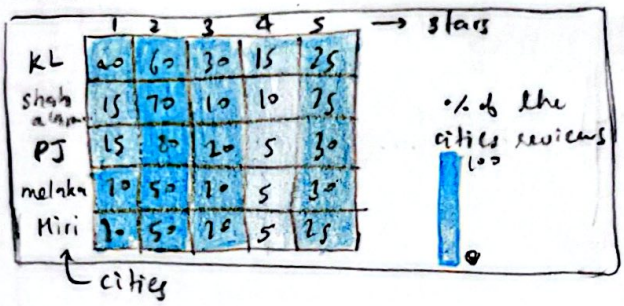

for every 100 reviews, how many are bad?
how many are good?

waffle chart

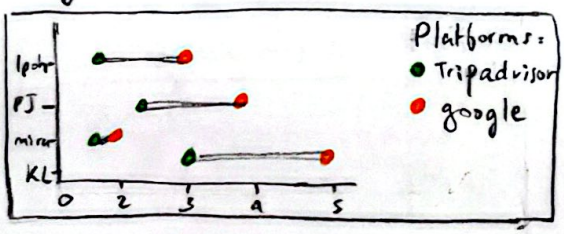

Scanned with CamScanner

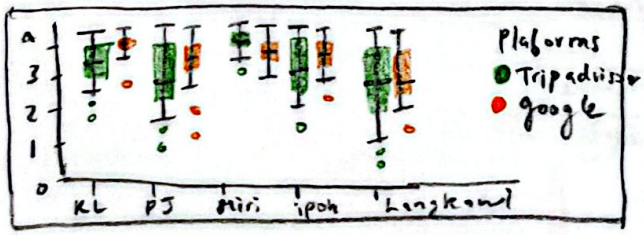

then more details through a heat map to see any patterns

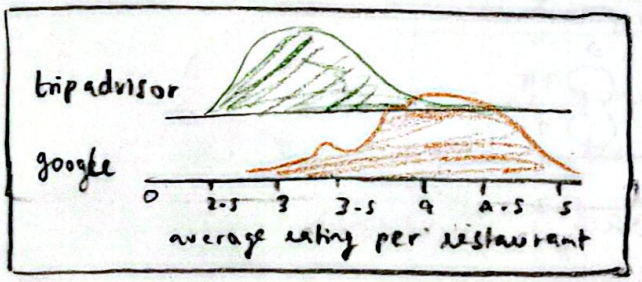

3. Does the platform matter?
Compare the difference between two review apps using a connected dot plot

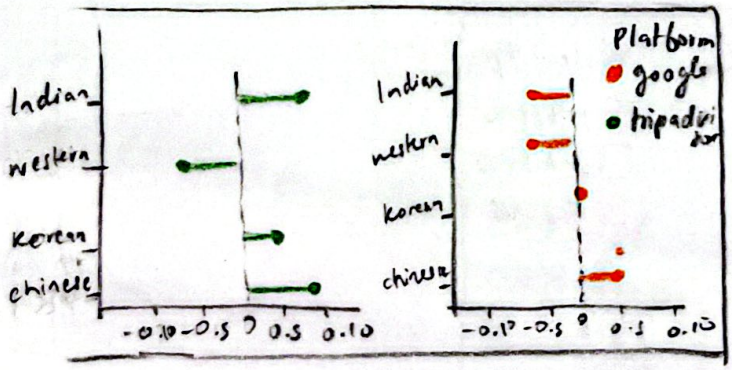

4. Inside the numbers
use a boxplot to see how the averages vary within different cities

see how the average ratings vary using a ridgeline chart

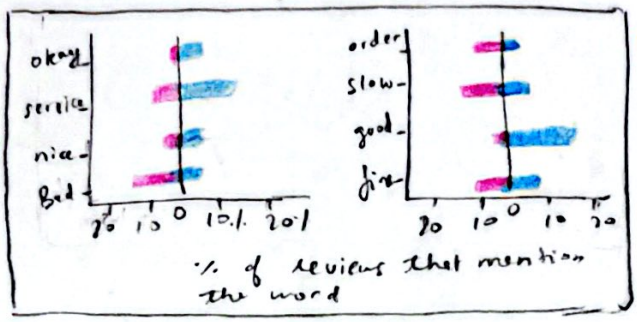

5. Does the food type matter?
use lolipop chart to see which cuisine influenced the rating

Scanned with CamScanner

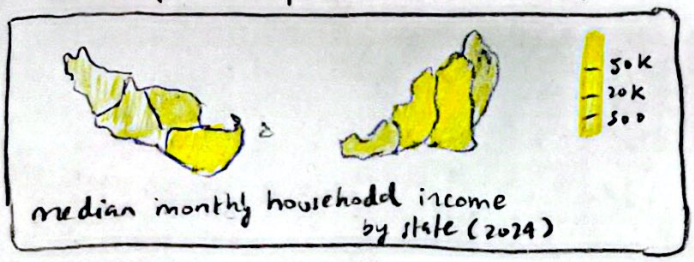

6- What people actually say

use a butterfly chart to understand the words that influence a reviews

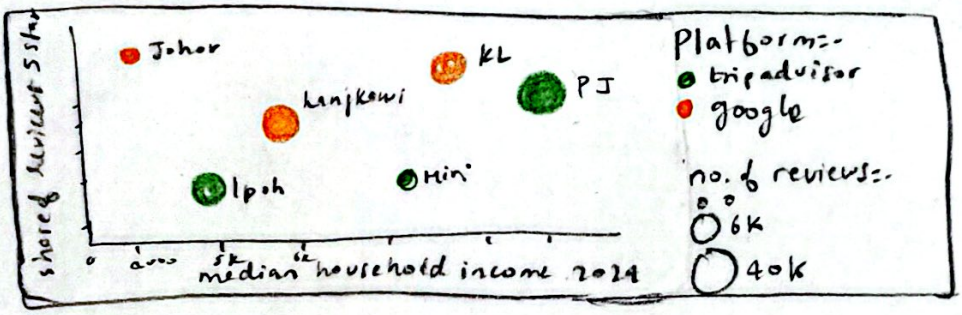

7. Does money explain anything

use choropleth map to understand if the income explain the stars.

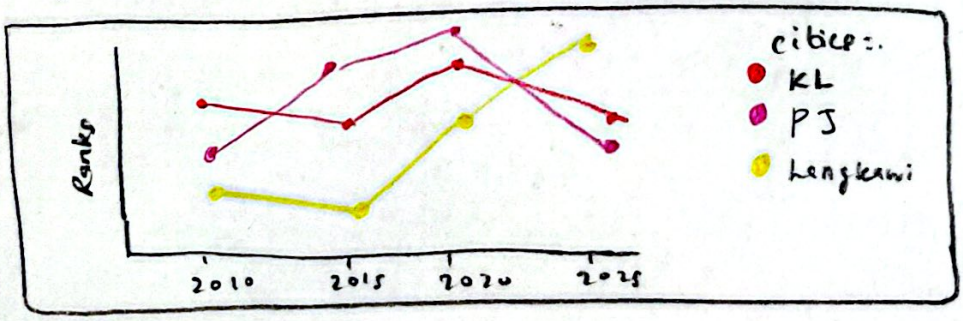

Use a scatter plot to see if richer states have better rated restaurant

8. How all of this changes overtime

using a bumpchart to see if the same stere score mean less each year
